Jupiter Sign Analysis

Structural Method — Complete Methodology with Updated Sign and Boundary Framework

Revision note: The existing methodology, procedural rules, sign definitions, and boundary comparisons are retained. This revision adds a revisable Jupiter-function/sign-manifestation framework, methodological flexibility, and predictive-performance criteria. Existing procedural rules remain in force except where the additions below explicitly refine them.

Part I — Structural Method and Procedural Rules

Jupiter Sign Analysis — Structural Method

Purpose

The purpose is to infer a person's Jupiter sign from their intellectual activity. The working hypothesis is that Jupiter represents a particular underlying function, currently described as intuitive legitimacy: the principle through which something becomes meaningful, valid, intelligible, trustworthy, real, sufficient, illuminating, or worth affirming. This definition is a hypothesis to investigate, not an unquestionable axiom. The underlying Jupiter function itself may need refinement or replacement if sustained evidence shows that the current formulation does not explain or predict well.

Jupiter is the underlying function; the sign describes the characteristic way that function manifests. Jupiter in Aries and Jupiter in Taurus therefore share the underlying Jupiter function but manifest it differently. The sign principles must remain genuinely distinct: treating Aries and Taurus as equivalent would erase the very distinctions the model is meant to explain. At the same time, do not assume in advance that every sign represents a wholly separate Jupiter function. Investigate how the underlying function and the sign-specific principle interact.

The central question is: What is the underlying Jupiter function, how does it manifest through this sign, and what evidence supports that interpretation in this person's intellectual activity? The aim is not to find a topic, method, concept, or argument that resembles a zodiac sign. The aim is to identify the organizing principle of the person's intellectual activity, infer the Jupiter function and its sign-specific manifestation, and test that inference against alternatives and predictive results.

Foundational Principle — Jupiter as Final Legitimacy

Current working model: Jupiter is an underlying function, provisionally described as intuitive legitimacy—the process through which something is experienced as meaningful, valid, intelligible, trustworthy, real, sufficient, illuminating, or worth affirming. The sign specifies the characteristic way this underlying function manifests. This function–manifestation relationship is foundational to the current model, but the precise definition of Jupiter's function remains revisable in light of evidence and predictive performance.

Do not treat “intuitive legitimacy” as an established fact merely because it is the current formulation. Test whether it explains the evidence better than plausible alternatives. The research may lead to a sharper definition, a different account of Jupiter's underlying function, or revisions to how a sign manifests that function. Any such revision must preserve meaningful distinctions between signs: Aries and Taurus, for example, cannot be treated as interchangeable without collapsing the model.

Within the current intuitive-legitimacy hypothesis, ask what ultimately makes the person's production of meaning feel sufficient or trustworthy. Do not confuse a method, concept, theory, or solution with the final source of legitimacy merely because it produces an intelligible result. A method may itself do the legitimating work. The proposed account remains an evidential inference, not a self-validating conclusion, and must be tested against alternatives and predictive results.

Final-ground test: do not demand a second source of legitimacy

When working within the current intuitive-legitimacy hypothesis, do not automatically ask what independently validates the proposed source of legitimacy. That question can wrongly demote a principle that is meant to be sufficient in itself. Instead ask: Does this principle actually perform the legitimating work, and does the person's intellectual activity provide positive evidence that it does? This is not permission to accept a sign without evidence: the proposed account must explain the whole intellectual activity and discriminate it from alternatives. However, do not protect the “final legitimacy” framework from revision if repeated failures suggest that the framework itself is inadequate. The distinction is between testing a principle within the current model and treating the model as immune to evidence.

1. First guess — invisible

Make one immediate, intuitive Jupiter-sign guess. Do not reveal it. Then set it aside. The first guess is not a hypothesis to be defended, developed, or refined. It has no privileged status in the subsequent analysis. Do not allow the first guess to determine what evidence is selected, what concepts are emphasized, or how the person is described. The analysis that follows must be able to reach a completely different sign.

2. Fundamental problem

Ask: What does she/he consider a fundamental problem? Identify the problem the author is actually trying to solve. Do not reduce this to subject matter. Ask what is inadequate, missing, contradictory, misunderstood, or unresolved from the author's point of view.

3. Why does the problem matter?

Ask: Why does this problem matter to the author? What would remain wrong, incomplete, unintelligible, or unsatisfactory if the problem were not solved? This begins to reveal what the author actually values.

4. Concepts and titles

Ask: What are the key concepts and ideas? What are the book titles? Concepts and titles are clues about where to focus attention, not direct evidence for Jupiter. Do not infer: concept → sign Instead ask: What does this concept actually do in the author's intellectual system?

5. Problem → solution geometry

Ask: How does the author address the problem? What is the proposed solution? Reconstruct the movement: problem → response → transformation → solution Do not classify the individual stages by signs. The purpose is to understand the author's characteristic way of solving problems.

6. What is the point of the author?

Ask: What is the point of this author? Why did she/he use these concepts? What did she/he show? Now reconstruct the theory as a whole. Look across different arguments, books, concepts, and methods. Ask: What is the same intellectual operation underneath them? An individual argument is evidence for understanding the whole. It is not automatically evidence for Jupiter. A person may make one argument that resembles Scorpio, another that resembles Pisces, another that resembles Aquarius, and another that resembles Aries. Do not classify the parts and then choose the most common sign. Ask instead: What are all these arguments doing together?

7. What kind of production of meaning does the author ultimately trust?

Ask: What kind of production of meaning does she/he ultimately trust? This is still part of the sign-free analysis. Do not answer: Gemini, Libra, Scorpio, Capricorn, etc. Do not translate the answer into zodiac terminology. Instead describe it in ordinary intellectual language. For example: meaning emerges when different perspectives are compared or: something becomes convincing when its necessary conditions are understood

or: understanding develops by penetrating beneath the surface or: something becomes meaningful through continuity with what came before These are descriptions of the person's intellectual valuation. They are not yet Jupiter interpretations. Do not ask which sign corresponds to them.

Mandatory separation: mechanism vs. source of legitimacy

Distinguish:

- phenomenon: what the person addresses;
- mechanism: how the person operates;
- structure: the conditions or relationships organizing the work;
- product: what the work produces or accomplishes;
- horizon: the broader context within which the work becomes meaningful;
- source of legitimacy: why this production of meaning is intuitively valid or trustworthy. Do not infer the source of legitimacy directly from a conspicuous method, structure, product, or subject. A mechanism is evidence for a Jupiter principle only when the connection between them is explicitly demonstrated. Apply the

Mechanism-Removal Test: If the person's characteristic method were replaced by a different method, what underlying principle would still explain why the resulting meaning matters? This is a diagnostic question, not a claim that the method can literally be removed without changing the work. The purpose is to distinguish how meaning is produced from why that production of meaning is trusted.

Method and final legitimacy can coincide

Do not assume that a characteristic method and the final source of intuitive legitimacy must be separate. A method can itself be the final source of legitimacy when the person trusts that mode of meaning-production as fundamentally sufficient. Do not demote a candidate to “mere method” unless positive evidence shows that it serves a distinct legitimating principle. The Mechanism-Removal Test is diagnostic, not a presumption that method is subordinate: if replacing the method would destroy the very basis on which the meaning is trusted, that is evidence that method and legitimacy may coincide. If they are distinct, identify what independently legitimizes the result and why that principle better explains the whole activity. The same feature may operate simultaneously as method, a meaning-generating mechanism, and final source of legitimacy. Its mere presence is not enough; establish whether it actually does the legitimating work.

8. Complete the analysis before guessing

This is the decisive structural rule. At this point, stop the analysis. Do not introduce the twelve signs yet. Do not rank signs. Do not say that the person's activity is “Gemini-like,” “Capricornian,” “Scorpio-like,” etc. Do not compare candidates. Do not make a preliminary Jupiter conclusion. Instead, produce a final sign-free synthesis. Ask: What is this person's entire intellectual activity doing? Then: What does this person ultimately trust as a way of producing understanding or meaning? And finally: Why does that way of producing meaning seem legitimate to this person? The answer must be expressed entirely in ordinary conceptual language. This is the endpoint of the research/analysis phase.

Lock the synthesis provisionally. Record the sign-free synthesis and the proposed source of legitimacy as the reference for the sign assessment. Do not revise either merely because a candidate sign is difficult to defend. Revise them if new factual evidence, a demonstrable analytical error, or a genuinely better research question or method warrants it; explain the reason and reassess all twelve signs against the revised synthesis. The lock prevents candidate-driven reinterpretation, not legitimate learning from evidence. If the source of legitimacy cannot be stated clearly without zodiac terminology, return to the factual analysis rather than proceeding to sign selection.

9. STEP BACK

Now remove:

- the author's terminology,
- the technical machinery,
- individual arguments,
- book titles,
- disciplinary vocabulary. Ask: What is this person's entire intellectual activity doing? Write 2–4 sentences. Then ask: What is the common intellectual movement connecting the different parts? And: Why does that movement produce meaning for this person? Do not name a zodiac sign. The result should be understandable even if astrology did not exist.

10. Twelve-sign analysis — no guess yet

Only now introduce the twelve Jupiter principles. Do not guess a sign yet. The previous hidden first guess is discarded. Do not ask: “Was my first guess correct?” Instead, test all twelve principles independently against the completed sign-free analysis. Do not begin with the most obvious match. Do not name a “strong candidate.” Do not rank signs. Do not eliminate signs in order to reach another sign. For each sign, ask what that principle would mean as the source of intuitive legitimacy in this particular person, and whether the completed analysis provides genuine evidence for it. A sign may receive a short assessment when there is little or no supporting evidence, but every sign must actually be considered. Use the same assessment template for all twelve signs. For each sign, state:

1. What specific feature of the locked synthesis would this principle explain?

2. What source of intuitive legitimacy does the sign propose?

3. What positive evidence supports it?

4. What evidence weighs against it, or what necessary evidence is missing?

5. What distinguishes it from its closest structural alternatives? Do not give one sign a detailed, charitable interpretation while dismissing another with a superficial objection. Symmetry means applying the same evidential standards, not forcing every sign to look equally plausible. Do not begin by choosing a candidate and constructing an argument for it. Do not change the synthesis, select a different work, or shift the level of analysis to make a particular sign fit. The candidate must be tested against the analysis; the analysis must not be generated by the candidate.

Part II — Updated Jupiter Sign Descriptions

The twelve sign descriptions below replace the earlier sign-definition section. The wording, geometries, critical distinctions, and exclusions are drawn from the second document.

Aries

Aries grants intuitive legitimacy to the originary encounter/act that establishes something as present, significant, or real before it is mediated by a more elaborate conceptual structure.

Geometry: primary givenness - > origination - > the first act by which something enters intelligibility as a a reality

primary givenness → problem of how something first becomes intelligible as a reality → originary act/encounter → something enters intelligibility as present/significant/real → intuitive legitimacy

The critical distinction: validity begings through the act itself

not: merely differentation, novelty, independence, or action

Taurus

Taurus grants intuitive legitimacy to what is immanently real and sufficient within its own existence — something is meaningful/legitimate because of what it intrinsically is, rather than because of the act that first makes it salient or because of its relation to something else.

Geometry

particular thing - > instrict reality/whatness→ apprehension of that reality → legitimacy

Particular thing → question of its intrinsic whatness → apprehension of what it intrinsically is → legitimacy through intrinsic reality

The crucian word is instrinct

Taurus ask something like: what is this thing in itself, when I encounter its actual being rather than the abstraction or projections imposed upon it?

The Critical distinction: someting posseses significance through its own actuality, without needing an external validation

Not: merely concreteness, materiality, stability, or factuality

Gemini

Gemini

intuitive legitimacy through corresponde or translation between distinct domains, where crossing between them generates new intelligibility

Geometry is:

Domain A → limit of intelligibility → correspondence/translation → Domain B → new intelligibility unavailable from A alone

The critical distinction: distinct perspectives confront one another and generate intelligibility through their encounters

not: merely communication, comparison, similirality or having multiple perspectives

Note: the distinct domain be conceptual, experiential, representational, or structrural; Gemini can operate through correspondence between diffferent presentations or modes of givenness of the same thing

Cancer

Cancer

Something has meaning because a prior reality is carried forward into the present, so the present particular contain or expresses its own living continuity

geometry:

past/inherited reality - > carried in to present - > transformed continuation - > present meaning

The important thing thing is internal continuity. The past isnt’t merely a backround context surrounding the present; it is constitively present within it.

Past/inherited reality → problem of its continued presence → carried into present → transformed continuation → present meaning

The decisive point is constitutive continuity: the past doesn't merely explain the present from outside; the present contains the past within its own form.

Critical distinction: something becomes intelligible through a continuity in which it was already situated

Not: merely history, tradition, context or emotional attachments

Leo

Leo

A possibility acquires concrete reality and meaning by realized thourgh a particular subject or agent

Geometry:

possibility exists - > particular subject/agent - > realization by agent - > possibility becomes actual

The key disctions:

The key distinction is between a subject causing something to happen and a subject's participation being necessary for that possibility to acquire its particular meaning or actuality.

Possibility exists → need for realization → particular subject/agent → realization by agent → possibility becomes actual

The crucial distinction is that the agent does not create the possibility itself. The possibility already exists; the particular subject is the vehicle through which it becomes actual.

Not: authorship, self-expression, ego, or creating the possibility itself

Virgo

Virgo

Something becomes legitimately understandable or actionable when the distinctions, requirements, and structure actually present in the particular situation are correctly discriminated, rather than projected into.

Geometry:

undifferentiated field → exact discrimination → actual structure/requirements become clear - > valid understanding/response

The important part is the accuracy of the discrimination

The key distinction:legitiacy comes from discerning what is actually present, pricely rather than approximately

Not: precision, analysis, classification or detail merely as methods

Libra

Libra

Intuitive legitimacy granted to the meaningful relation between distinct elements when that relation itself produces or reveals the valid form of meaning

Geometry:

A<- ->B - > relation becomes meaningful/operative - > validity of meaning emerges

What makes something Libra? The thinker naturally sees reality as intelligible through the relation between differentiated things. The relation isn't merely a method for comparing things that already have their meaning. Rather, the interaction/configuration between them is what makes the meaning intelligible

The key distinction: legitimacy arises through a meaning relation between distinct elements

not: merely relation, cooperation, balance, comparison, or considering multiple perspectives

Scorpio

Scorpio is legitimacy through penetrating beneath the apparent form to the formative reality/process that produces it

The deeper principle: what appears on the surface becomes genuily intelligible when its underlying generative structure is disclosed

Geometry: apparent phenomenon - > penetration/disclosure – formative reality - > understanding

The crucial thing is generation: what is underneath isnt merely "deeper" or hidden; it is what produces, structures, or determines the appearance

not: merely depth, hiddeness, secrecy, psychology, or looking beneath the surface

Sagittarius

Sagittarus

The key distinction:

A particular situation becomes meaning or its apparent problem changes status when it is understood within more comprehensive horizon that exceeds the immediate situation

Geometry: local phenomenon/problem → expansion of horizon→ larger principle/context → transformed intelligibility

The crucial point is that the larger horizon does explanatory work. It isnt just ”thinking broadly”.

Not: merely breadth, universality, abstraction, philosophy, or generalization

Capricorn

Capricorn

A form, proposition, relation or conceptual structure becomes legitimately meaningful when its actual implication, scope, consequences, and condition of application are worked out

Geometry:

given form/structure - > work through it - > determine implications/limits - > legitimate scope

The key distinction. The crucial word is entailment. Capricorn asks: if this structure is really what it claims to be, whoat does it actually entail.Capricorn isnt merely structure. It is following the structure through its consequences.

Not: merely structure, discipline, rules, authority, or practicality

Aquarius

Aquarius

Aquarius grants intuitive legitimacy to the abstract architecture through which heterogeneous elements become intelligible while retaining their distinctness.

The deeper principle:

Heterogeneous elements become intelligible through an abstract architecture allowing them to coexist without reduction to one homogeneous unity. The architecture makes their differences and positions within a field intelligible; it does not require the elements to share one essence, collapse into one identity, or derive their meaning from a single unifying relation. Where necessary, the architecture itself may be reorganized to make the field more intelligible.

Geometry:

Heterogeneous elements → abstract architecture of relations, categories, or rules → intelligible coexistence without reduction to homogeneous unity → possible reorganization of the architecture → renewed intelligibility

Critical distinction: Aquarius does not make heterogeneous elements intelligible by reducing them to one common substance or by making their interaction produce a synthesis. It makes their coexistence intelligible through an abstract architecture that preserves meaningful differences.

Not: merely objectivity, systematization, abstraction, innovation, or impersonality

Pisces

Pisces is legitimacy through immersion in a larger field of meaning, where apparently separate boundaries become less fundamental

The deeper principle: what appears to be an isolated thing/person/position becomes meaningful by participating in a larger field of relation, forces, perspectives, or becoming.

Geometry:

Apparently separate particular - > immersion/participation - > dissolution of isolated boundaries - > larger field

Not: merely unity, spirituality, interconnectedness, or holism

Part III — Remaining Methodology: Assessment and Reassessment

Complete the twelve-sign analysis before forming any Jupiter hypothesis.

11. Only after the twelve-sign analysis: make the guess

Now ask: Which of the twelve principles best describes the source of legitimacy that the completed analysis has uncovered? Only now may a sign be selected. The first sign named as a possible Jupiter sign must therefore appear after the complete twelve-sign analysis, never before it. Do not treat the first selected sign as established. If two or more principles are genuinely close, compare them only after the full twelve-sign field has been considered. The final choice must explain the whole intellectual activity, not merely the most conspicuous feature. Discrimination requirement Compatibility is not enough: a sign can plausibly describe some feature without identifying the source of legitimacy. The selected sign must explain the source of legitimacy more specifically than its strongest competitors. Do not claim that one sign is stronger unless you can state the concrete distinction that makes it stronger. Mandatory pre-guess audit Before presenting the guess, check:

1. Have I identified why the production of meaning is legitimate, rather than merely describing its topic, method, structure, product, or goal?

2. Did the sign emerge from the evidence, or did I reinterpret the evidence to fit the sign?

3. Have I tested the strongest alternatives against the same locked synthesis and evidential standards?

4. Am I rejecting an alternative because of contrary evidence, or because I have already committed to another sign?

5. Would this reasoning still support the selected sign if all previous guesses and rejected signs were hidden?

6. Is the selected sign more discriminating than the alternatives, or merely compatible with the person? If this audit reveals a substantive failure, revise the analysis before presenting a guess. If the evidence does not discriminate adequately, state that the inference remains uncertain instead of manufacturing a winner.

12. Distinguish activity from legitimacy

Now test the strongest apparent matches. Ask: Is this sign describing what the author does, or why what the author does counts as meaningful? This distinction is essential. For example:

- precision may be Virgo without Jupiter being Virgo;
- penetration may be Scorpio without Jupiter being Scorpio;
- synthesis may be Aquarius without Jupiter being Aquarius;
- continuity may be Cancer without Jupiter being Cancer;
- broad interpretation may be Sagittarius without Jupiter being Sagittarius;
- relation may be Libra without Jupiter being Libra;
- exchange may be Gemini without automatically making Jupiter Gemini; if the exchange itself is the final source of legitimacy, it may be Jupiter-level evidence. The question is: Which principle explains why the person's characteristic activity has intellectual value for them?

13. Whole-person test

For each serious candidate ask: Does this principle explain the different parts of the person's intellectual activity as expressions of one underlying valuation? A strong candidate should explain:

- the fundamental problem,
- the solution,
- the concepts,
- the different works,
- the characteristic intellectual movement,
- and the final source of legitimacy. It should not merely explain the most conspicuous feature.

14. Internal consistency

Ask: Does the proposed Jupiter principle remain convincing across the whole person? If the answer is no, reject it. Do not modify the person's intellectual activity to preserve a candidate. If a sign explains one part beautifully but requires several other major parts to be treated as secondary, accidental, or irrelevant, it is probably not the Jupiter principle.

15. Genericity test

Ask: Would this reasoning apply equally well to many other major thinkers in the same field? If yes, the candidate may be too generic. The Jupiter interpretation should explain something characteristic about this person's way of producing legitimacy.

Part IV — Updated Boundary Comparisons

These comparisons replace the earlier boundary material and use the updated sign formulations, including Leo as a participatory subject.

Aries: boundary comparisons

Aries vs Taurus

Aries: legitimacy begins through an originating act.

Taurus: legitimacy belongs to what is intrinsically real in itself.

Aries vs Leo

Aries: the act of origination establishes legitimacy.

Leo: a possibility acquires concrete reality and meaning through the participation of a particular subject or agent.

Aries vs Capricorn

Aries: legitimacy does not depend on prior determining conditions.

Capricorn: legitimacy derives from the conditions that make something possible.

Aries vs Gemini

Aries: meaning begins through origination.

Gemini: meaning emerges through encounter between distinct elements.

Taurus: boundary comparisons

Taurus vs Aries

Taurus: legitimacy comes from intrinsic being.

Aries: legitimacy comes from origination.

Taurus vs Leo

Taurus: legitimacy comes from intrinsic reality.

Leo: a possibility becomes actual through the participation of a particular subject or agent.

Taurus vs Capricorn

Taurus: something is legitimate through what it intrinsically is.

Capricorn: something is legitimate through the conditions necessary for it to exist.

Taurus vs Cancer

Taurus: legitimacy does not depend on prior embeddedness.

Cancer: legitimacy emerges from what is already carried within the particular through continuity.

Gemini: boundary comparisons

Gemini vs Libra

Gemini: interaction generates something new.

Libra: the relation itself becomes meaningful or legitimate.

Gemini vs Aries

Gemini: meaning emerges through encounter.

Aries: meaning originates through an initiating act.

Gemini vs Virgo

Gemini: distinction between perspectives generates new meaning.

Virgo: distinction determines what is actually present.

Gemini vs Aquarius

Gemini: distinct elements interact and generate something.

Aquarius: heterogeneous elements become intelligible through an abstract architecture that allows them to coexist without reducing them to one homogeneous unity.

Cancer: boundary comparisons

Cancer vs Taurus

Taurus: legitimacy comes from intrinsic being.

Cancer: legitimacy comes from what the particular already carries within itself through continuity.

Cancer vs Capricorn

Cancer: what already exists within the inherited continuity shapes emergence.

Capricorn: necessary conditions determine how something can exist.

Cancer vs Sagittarius

Cancer: meaning comes from prior embeddedness.

Sagittarius: meaning comes from placement within a wider horizon.

Cancer vs Pisces

Cancer: the particular remains constituted by its prior continuity.

Pisces: the particular becomes meaningful through participation in a larger field.

Leo: boundary comparisons

Leo vs Aries

Leo: legitimacy arises through the subject's necessary participation in realizing an already-existing possibility.

Aries: legitimacy belongs to the originating act.

Leo vs Taurus

Leo: a possibility acquires concrete reality and meaning through a particular subject or agent.

Taurus: something is legitimate through intrinsic reality.

Leo vs Sagittarius

Leo: the particular subject or agent is the vehicle through which an already-existing possibility becomes actual.

Sagittarius: the particular gains significance through a larger horizon.

Leo vs Libra

Leo: legitimacy arises through the subject's necessary participation in realizing an already-existing possibility.

Libra: legitimacy emerges through the meaningful relation between distinct elements.

Virgo: boundary comparisons

Virgo vs Gemini

Gemini: distinctions interact and generate new intelligibility.

Virgo: distinctions clarify what is actually present.

Virgo vs Scorpio

Virgo: determines what is present.

Scorpio: penetrates toward what generates what is present.

Virgo vs Capricorn

Virgo: determines what actually exists in the particular case.

Capricorn: determines what must be in place for something to exist.

Virgo vs Taurus

Virgo: legitimacy comes through accurate discrimination.

Taurus: legitimacy comes through intrinsic reality itself.

Libra: boundary comparisons

Libra vs Gemini

Libra: the relation itself becomes meaningful.

Gemini: interaction generates something new.

Libra vs Taurus

Libra: legitimacy emerges between distinct realities.

Taurus: legitimacy comes from intrinsic reality.

Libra vs Leo

Libra: legitimacy comes through relation.

Leo: legitimacy arises through the subject's participation in making an already-existing possibility actual.

Libra vs Aquarius

Libra: legitimacy depends on a meaningful relation between elements.

Aquarius: heterogeneous elements can coexist intelligibly within an abstract architecture without being unified by a particular relation.

Scorpio: boundary comparisons

Scorpio vs Virgo

Virgo: What is actually present?

Scorpio: What generates what is present?

Scorpio vs Capricorn

Scorpio: identifies the generative reality/process producing the phenomenon.

Capricorn: identifies the necessary conditions governing its possibility.

Scorpio vs Aquarius

Scorpio: penetrates toward the underlying generative reality.

Aquarius: grasps the abstract architecture that makes heterogeneous elements intelligible while preserving their differences.

Scorpio vs Pisces

Scorpio: penetrates into the particular to discover what generates it.

Pisces: immerses the particular in a larger field in which its boundaries become less fundamental.

Sagittarius: boundary comparisons

Sagittarius vs Cancer

Cancer: significance comes from prior embeddedness and continuity.

Sagittarius: significance comes from a wider horizon.

Sagittarius vs Capricorn

Sagittarius: the larger horizon determines significance.

Capricorn: necessary conditions determine possibility.

Sagittarius vs Pisces

Sagittarius: the particular remains distinct while gaining meaning through a larger horizon.

Pisces: the particular gains meaning through participation in the larger field itself.

Sagittarius vs Leo

Sagittarius: the particular gains legitimacy from a larger horizon.

Leo: a particular subject or agent realizes an already-existing possibility; the subject's participation is necessary for that possibility to become actual.

Capricorn: boundary comparisons

Capricorn vs Virgo

Virgo: determines what is actually present.

Capricorn: determines what must be present for something to be possible.

Capricorn vs Scorpio

Capricorn: identifies necessary conditions governing existence.

Scorpio: identifies the generative reality producing the appearance.

Capricorn vs Sagittarius

Capricorn: conditions determine possibility.

Sagittarius: a larger horizon determines significance.

Capricorn vs Aries

Capricorn: legitimacy depends upon determining conditions.

Aries: origination does not derive its legitimacy from prior conditions.

Aquarius: boundary comparisons

Aquarius vs Gemini

Gemini: distinct perspectives interact and generate new meaning.

Aquarius: distinct elements become intelligible through their positions within an abstract architecture, without requiring their interaction to generate new meaning.

Aquarius vs Libra

Libra: legitimacy depends upon meaningful relation.

Aquarius: heterogeneous elements can remain legitimate without a particular relation providing their unity.

Aquarius vs Scorpio

Scorpio: apparent multiplicity is penetrated toward underlying generative reality.

Aquarius: heterogeneous elements remain distinct yet intelligible within an abstract architecture, without reduction to homogeneous unity.

Aquarius vs Pisces

Aquarius: distinctions remain intelligible within an abstract architecture that allows heterogeneous elements to coexist without collapsing into one unity.

Pisces: distinctions become permeable through participation in the larger field.

Pisces: boundary comparisons

Pisces vs Sagittarius

Sagittarius: the particular remains distinct but gains significance through a larger horizon.

Pisces: the particular participates in the larger field itself.

Pisces vs Aquarius

Aquarius: heterogeneous distinctions remain intelligible through their positions within an abstract architecture.

Pisces: distinctions become permeable through participation.

Pisces vs Cancer

Cancer: the particular contains and continues a prior reality.

Pisces: the particular participates in a larger field beyond its own inherited continuity.

Pisces vs Scorpio

Scorpio: penetrates toward what generates the particular.

Pisces: dissolves the sharp separation between particular and surrounding field.

Part V — Final Inference and Research-Blindness Rules

17. Final Jupiter inference

Only now give the answer. The final sign should be the principle that best explains: why the person's entire intellectual production has the form it has, and why that form of producing meaning is intuitively legitimate to them. Do not choose the sign that explains the most individual statements. Choose the sign that explains the organizing reason those different statements, methods, concepts, and conclusions have meaning for this person.

18. Independent reassessment

If the result is uncertain, do not simply move from one candidate to its nearest competitor. Do not do: Virgo → Capricorn → Aquarius → Gemini as though the signs form a ladder. Instead: return to the factual record and locked sign-free synthesis → reopen the live candidate field → independently reassess the whole person. After inc: no candidate-driven reinterpretation

1. Permanently remove the rejected sign from that author's candidate pool.

2. Preserve the factual record and the locked sign-free synthesis.

3. Do not treat rejection as evidence for another sign.

4. Do not use the rejected sign as a contrast, fallback, or source of interpretive clues.

5. Do not reinterpret the author to fit whichever signs remain.

6. Reassess the remaining signs against the same synthesis and the same evidential standards.

7. If new factual evidence or a demonstrable analytical error requires revising the synthesis, explain the reason and reassess every live candidate against the revised synthesis.

8. A previously proposed alternative has no special status; it must be assessed afresh. But if you have seriously considered some signs as a second option, the reasons for that choice are still valid unless reassesssment change evaluation. But reassessment has to happen without a priory commitments to certain sign Before rejecting any candidate, state what positive evidence would be required for that candidate, then check whether the author's activity satisfies that criterion. Never reject a sign merely because another sign currently appears stronger. If a sign is explicitly rejected, remove it from the search pool and never guess it a second time. A rejected sign has no special status. A previously proposed alternative has no special status. Rejecting one sign is not evidence for another. Always justify why a candidate is weak or why its source of intuitive legitimacy is not primary. That evaluation must emerge from the reassessment itself, not from attaching an appropriate label after the decision has already been made. Escalation after repeated rejections After 3 rejected guesses, return to primary or authoritative sources and verify the factual basis of the analysis. Identify whether the difficulty comes from missing evidence, an inaccurate account of the author, or failure to distinguish mechanism from source of legitimacy. After 6 rejected guesses, do not produce another sequential guess. Conduct a complete comparative reassessment of every remaining candidate in one response, using the same evidence and locked synthesis. The shrinking candidate pool is a restriction on permitted conclusions, not a source of evidence. If the remaining candidates cannot be distinguished by positive evidence, report uncertainty rather than continuing to generate plausible interpretations.

Core methodological rules

1. The first guess is invisible.

2. The first guess has no privileged status.

3. The substantive analysis comes before the Jupiter-sign inference.

4. No zodiac signs are used to interpret the evidence during the substantive analysis.

5. Concepts and titles indicate where to investigate; they do not determine Jupiter.

6. Individual arguments are evidence for understanding the whole, not automatic Jupiter evidence.

7. Subject matter is not Jupiter.

8. Method is not automatically Jupiter; it may itself be the final source of legitimacy when the evidence establishes that it does the legitimating work.

9. Technical machinery is not Jupiter.

10. The most conspicuous intellectual operation is not necessarily Jupiter.

11. Production mechanism, validity criterion, and legitimating source must be distinguished.

12. All twelve principles must be considered after the analysis is complete.

13. A previous guess must not anchor the next inference.

14. Rejecting one candidate provides no positive evidence for another.

15. Once candidate is rejected, remove it from search pool

16. The final sign must explain the whole intellectual activity.

17. Blind retesting and answer-key separation. When making a fresh prediction for a previously analysed person, do not consult or use that person's stored correct answer, previous guesses, prior analysis, corrections, rejections, rankings, or conclusions as evidence, context, hypotheses, anchors, or candidate-selection information. The stored answer and history may be consulted only after the new prediction has been explicitly committed, for evaluation and benchmarking. Person-specific answer retention is permitted after the user reveals the correct answer; using that answer before committing to a fresh prediction is not permitted.

18. After a rejection, reassess candidates against the same locked sign-free synthesis; never reinterpret the author merely to fit a remaining sign. 19. Candidate rejection is a constraint on the answer, not evidence for another candidate. 20. Use symmetrical evidence standards for all twelve signs and require positive discrimination, not mere compatibility. 21. If the source of intuitive legitimacy remains unclear or the evidence cannot discriminate among candidates, state uncertainty instead of manufacturing a guess. 22.

23. After the user reveals the correct Jupiter sign, retain the confirmed answer and relevant guess history for benchmarking. Do not use the stored answer or person-specific history to generate a later blind prediction; compare against the answer key only after committing to that prediction. Retain general methodological lessons and refinements to the sign model separately from the answer key.

Research / Blindness Rules

Research the person, not the answer.

- Search only for their work, ideas, arguments, biography, interviews, books, etc.
- Never search for Jupiter, Jupiter sign, natal/birth chart, planetary placements, or equivalent terms.
- Do not search indirectly for astrological placements.
- If Jupiter information appears during research before the prediction is committed, do not use it as evidence; disclose that the blind test may be compromised.
- A correct answer revealed by the user after a committed prediction may be recorded as a reference label for evaluation and future benchmarking.
- During a later retest, keep the stored reference label and prior person-specific history out of the prediction process; compare with them only after committing to the new prediction.
- Search is for understanding the person, never for confirming or disproving a Jupiter hypothesis.
- The predicted Jupiter sign must come from the structural analysis, not from external astrological information.

The complete sequence

1. Hidden first guess ↓

2. Fundamental problem

↓

3. Why it matters ↓

4. Concepts and titles

↓

5. Problem → solution geometry

↓

6. What is the point of the whole intellectual project? ↓

7. What kind of production of meaning does the person trust? ↓

8. Complete the analysis — still no signs ↓

9. STEP BACK

— formulate the whole-person operation ↓

10. Twelve-sign analysis — still no guess ↓

11. Only now make the Jupiter guess ↓

12. Distinguish activity from legitimacy

↓

13. Whole-person test

↓

14. Internal consistency

↓

15. Genericity test

↓

16. Compare only genuinely close alternatives ↓

17. Final Jupiter sign

The fundamental rule is therefore: First understand the person. Then understand his ideas and what are general ideas behind them. Then understand what makes their intellectual production legitimate. Only after that ask which Jupiter principle describes it. Not: Guess a sign → interpret the person through that sign → defend or replace the sign. And not: Analyze the person's arguments in sign-like terms → select the sign that appears most often. The correct logic is: Understand → synthesize → step back → assess all twelve → only then select the Jupiter principle. The sign is the interpretation of the analysis. It must not be the hidden framework used to produce the analysis. No Jupiter sign may be named, proposed, ranked, or called a candidate until the complete twelve-sign analysis has been finished.

Part VI — General Boundary Discipline

FINAL BOUNDARY RULE The five boundaries are not five tests that must all be passed. They are the five most useful comparative controls for each sign. When a candidate appears plausible, ask: Which competing sign would explain this same observation differently? Then compare the two at exactly the same level: source of intuitive legitimacy —not:

- subject matter,
- mechanism,
- technical method,
- product,
- explanatory depth,
- necessity,
- or surface resemblance. The decisive question remains: What is actually doing the legitimating work? And the overall direction remains: PERSON → UNDERSTANDING → VALUATION → LOCK → COMPARE → TEST The boundaries prevent the sign from being chosen merely because its description sounds attractive. They force the analysis to determine why this sign rather than its closest structural alternatives.

Anti-premature-closure rule

Do not stop at the first coherent explanation. A coherent explanation establishes compatibility, not correctness. Before selecting a sign, test whether the strongest competing principles explain the same evidence differently, and identify the specific evidence that discriminates between them. Do not give a candidate extra credit for being elegant, abstract, comprehensive, or easy to describe. Do not reject a competitor without stating what positive evidence its principle would require and whether that evidence is actually absent or contradicted. If no candidate wins by a meaningful evidential distinction, leave the inference unresolved.

XII. THE BOUNDARY PRINCIPLE

The comparative descriptions above are not extra sign meanings. They are boundary controls. Do not identify a sign merely because one of its characteristics appears. When two signs appear plausible, ask: Which one explains the source of legitimacy? The distinction must be made at the same level for both candidates.

The boundary question is therefore: What exactly is doing the legitimating work?

Jupiter Sign Analysis — Updated framework

Part VII — Answer Retention, Blind Retesting, and Model Improvement

The answer is retained after disclosure; it is not used to generate the prediction. The user-specific rule is not to forget confirmed answers. After the user reveals the correct Jupiter sign, record that answer as the reference label for the user's research and benchmarking. Also retain the relevant prediction history: each guess, its order, whether it was accepted or rejected, the number of attempts, and whether the first guess was correct. Do not invent or infer a confirmed answer when the user has not revealed one.

1. Before the answer is revealed

Conduct the analysis under the full methodology. Research the person, produce and lock the sign-free synthesis, assess all twelve signs symmetrically, and commit to the prediction before receiving or consulting a reference answer. If the person has been analysed before, the stored answer, previous guesses, and previous person-specific reasoning must not influence the new prediction.

2. After the user reveals the answer

Record the revealed sign and the prediction outcome. Keep the answer key distinct from the analysis and guess history. A correct answer is a reference label for this evaluation process; it does not, by itself, prove that the reasoning was sound. A rejected guess is a known error for that attempt, not evidence that any particular alternative is correct.

3. Learn from successes and failures

Review the reasoning after the outcome is known. Ask what the result reveals about analytical-level errors, insufficient positive discrimination, vague sign definitions, weak boundaries, research gaps, or confusion between selection, production, validation, and final legitimacy. Retain generalizable methodological lessons and revise the sign model when the lesson is genuinely useful beyond the individual case. Do not revise definitions merely to rationalize a correct answer, and do not treat a correct outcome as proof of a sound argument.

4. Blind retesting of a previously analysed person

When the same person is tested again, perform a fresh analysis using the current methodology. Do not consult the answer key, prior guesses, previous analysis, or person-specific conclusions before making and explicitly

committing to the new prediction. After commitment, compare the prediction with the stored answer and update the benchmark record. The prior answer is allowed as an evaluation label, not as predictive evidence.

5. Benchmark the model over time

Where sufficient records exist, track:

- first-guess accuracy;
- accuracy within a specified number of guesses, such as three;
- mean or median guesses required to reach the revealed answer;
- clean-retest accuracy on previously tested people;
- performance before and after a methodological revision; and
- reasoning quality, including whether the final choice was supported by positive, discriminating evidence.

Keep first-guess accuracy distinct from eventual success after repeated guesses. Do not claim that the model improved merely because it eventually reached the answer after exclusions. When comparing versions, record which methodology was in use and apply comparable scoring rules.

6. Separate the answer key from the learning log

Maintain two logically distinct records:

- Answer key and benchmark history: confirmed answers revealed by the user, predictions, guess order, outcomes, and attempt counts.
- General learning log: reusable lessons about sign principles, boundary distinctions, evidence quality, research practice, and inference errors.

The general learning log may be informed by the outcomes, but it should not preserve a person's identity or recognizable profile as a disguised answer key. Person-specific answers may be retained openly as benchmark data, subject to the blind-retesting rule above.

7. Preserve the integrity of the blind test

Research the person's work, not astrological placements. If a Jupiter placement is discovered during research before the prediction is committed, do not use it as evidence and disclose that the blind test may be compromised. A user-revealed answer after a committed prediction is different: it is the legitimate outcome label for evaluation. During any subsequent retest, the answer must remain outside the prediction process until the new prediction has been committed.

8. Treat confirmed outcomes as evidence for evaluation, not automatic proof of theory

A single confirmed outcome may expose a weakness or suggest a refinement, but it does not automatically validate a sign definition or prove that the reasoning was correct. Seek generalizable distinctions, compare them with other independent cases, and preserve uncertainty when the evidence is insufficient. The goal is to improve both predictive performance and the quality of the structural model.

Core rule: Remember the correct answer after the user reveals it; learn from the outcome; keep the answer and prior person-specific reasoning out of a fresh prediction; and compare with the answer key only after committing to that prediction.

Provisional Assessment and Clean Reassessment Rule

Every sign assessment is a provisional interpretation, not a settled description of the person, the sign, or the evidence. An assessment must never become an unquestioned premise in later reasoning. When reassessing, return to the locked sign-free synthesis and the sign's foundational principle. Reconstruct what that principle would mean in this particular case from the beginning, using the same underlying evidence and the same evidential standards as for every other live candidate.

Do not inherit the wording, emphasis, omissions, or conclusion of an earlier assessment merely because it has already been written. Earlier assessments may be inspected as arguments to audit after the fresh assessment, to identify anchoring, omissions, or errors—not to inherit their conclusions. Ask whether each assessment represented the sign's actual principle, addressed the source of intuitive legitimacy at the correct analytical level, and considered relevant counterevidence. If an assessment was superficial, misapplied, incomplete, or based on the wrong level of analysis, explicitly correct that assessment before proceeding.

A rejected argument is not a rejected sign principle, and a plausible argument is not proof of a sign. For an explicitly rejected guess, obey the existing rule that the sign is removed from that person's candidate pool and must not be guessed again within that same guessing sequence. However, do not let the rejected sign's previous characterization, or the argument used to reject it, shape the interpretation of the remaining candidates. The exclusion is a constraint on the permitted answer, not evidence for another sign. For a later, separately initiated blind retest, follow the benchmark rule: make a fresh prediction without using the old answer or person-specific history, then compare after commitment.

During reassessment, distinguish three things: (1) the sign's foundational principle; (2) the specific argument previously made for or against it; and (3) the evidence in the person's intellectual activity. Re-evaluate the relationship between the principle and the evidence rather than carrying forward the previous argument as fact. The purpose of reassessment is to improve the quality of analysis, not merely to shrink the candidate list.

Clean-reassessment checklist

- Return to the locked sign-free synthesis before examining prior sign assessments.
- Re-state each live sign's foundational principle in its own terms, without relying on the earlier assessment.
- Ask what positive evidence would support that principle as the source of legitimacy, and what evidence would count against it.
- Check whether the previous assessment confused subject matter, method, mechanism, product, or goal with the source of legitimacy.
- Inspect earlier reasoning only after the fresh assessment, to identify anchoring, omissions, or errors—not to inherit its conclusions.
- Apply the same evidential standard to every live candidate.
- If a general sign definition or boundary was misapplied, correct the model explicitly; do not change the person's sign-free synthesis merely to fit a candidate.
- Never let the shrinking candidate pool count as evidence. If the remaining candidates cannot be discriminated positively, state uncertainty.

Post-guess review questions

- What did the outcome reveal about the reasoning process, independently of the person's answer?
- Was a sign definition too broad, too narrow, ambiguous, or insufficiently distinguished from a neighbour?

- Would a general refinement improve discrimination across multiple cases, rather than merely explain this one?

- Does the proposed refinement improve future predictions without allowing the stored answer to leak into a blind retest?

- If no genuine general lesson emerges, leave the model unchanged.

Part VIII — Source, Mechanism, Validation, and Final Sufficiency

Source–Mechanism–Sufficiency Rule

Do not infer Jupiter from a person's characteristic intellectual operation, a necessary condition of their work, or a standard they use to validate results. Distinguish why a subject is selected, how meaning is produced, what warrants the resulting claims, and what ultimately makes that production of meaning legitimate. For each candidate sign, identify the specific point at which its principle would be sufficient, and compare this with the sufficiency conditions proposed by its closest alternatives.

Treat sign descriptions and boundaries as revisable theoretical models. When an assessment fails, investigate whether the failure reveals an incorrect sign definition, a weak boundary, an analytical-level error, or insufficient evidence. Revise general definitions only when the lesson is genuinely generalizable; never modify them merely to preserve or rationalize a particular guess.

Four analytical questions

- Selection — Why does this matter? Why is this phenomenon, problem, or question worth investigating at all?

- Production — How does understanding emerge? Through what process does meaning emerge: for example, comparison, discrimination, continuity, causal disclosure, participation, or another mechanism?

- Validation — What makes the result acceptable? What warrants trusting the result rather than treating it as arbitrary, superficial, or unsupported?

- Final legitimacy — Why is this kind of production of meaning fundamentally sufficient? What is the ultimate principle that makes this form of understanding meaningful or worth affirming?

These are analytical distinctions, not four separate Jupiter functions. Under the current model, Jupiter's underlying function is provisionally understood as final intuitive legitimacy, while the other levels provide evidence for reconstructing it. Do not infer that function directly from the reason a person selects a subject, the mechanism they use, or the standards they apply to their results. Establish the relationship between those levels first. The distinction is a working analytical framework, not a reason to rule out revisions if it repeatedly fails to explain or predict outcomes.

Source versus condition

A feature can be necessary without being the ultimate source of legitimacy. Exact discrimination may be necessary for good understanding without accuracy being the final principle that makes the understanding meaningful. Causal explanation may be necessary without causal disclosure being the ultimate ground. A wider context may be necessary without that context finally legitimizing the result. A subject's participation may be necessary without subjective participation itself being the final principle.

Distinguish necessary conditions, enabling mechanisms, standards of validation, and the final source of legitimacy. A diagnostic counterfactual is: if this feature remained necessary but no longer explained why the result was fundamentally meaningful or legitimate, would the person's intellectual project still make sense? Use this only as a diagnostic, not as conclusive proof; removing a feature can change the activity enough to make the counterfactual misleading.

Boundary refinement principle

A boundary distinction is valuable when it separates two principles that can explain the same observable activity for different reasons. Do not add merely more surface traits to a sign description. Clarify what makes the sign's characteristic process fundamentally sufficient, and what a competing principle would regard as sufficient instead.

Examples of useful boundary questions:

- Virgo / Scorpio / Capricorn: Is legitimacy grounded in correctly discerning what is actually present (Virgo), disclosing the formative process that produces the appearance (Scorpio), or working out what a structure entails, including its scope and limits (Capricorn)? These are not simply different degrees of analytical depth.
- Gemini / Libra / Aquarius: Does new intelligibility arise through exchange between distinct domains (Gemini), does the meaningful relation itself establish intelligibility (Libra), or does an abstract architecture make heterogeneous elements intelligible together while preserving their distinctness (Aquarius)?
- Leo / Libra / Sagittarius: Is the particular subject's participation fundamental to realizing an existing possibility (Leo), is the relation itself the legitimating source (Libra), or does a larger horizon explain the particular's significance (Sagittarius)?

These are boundary controls, not shortcuts to assigning signs. The presence of causes, precision, systems, relationships, subjects, or broad context does not by itself identify Jupiter. Always establish what is doing the final legitimating work.

Post-assessment model improvement

When an assessment fails, reconsider both the application and the model. Ask whether the sign was described accurately, whether a boundary distinction was missing, whether the reasoning confused selection, production, validation, and final legitimacy, or whether the evidence was simply insufficient. Generalize a refinement only when it could improve discrimination across cases. Do not reinterpret a person or revise a sign definition merely to rescue a guess.

Answer-key use and performance comparison

A revealed correct sign may be retained as a benchmark label. It may be consulted only after a fresh prediction has been committed. Compare first guesses, attempts required, and reasoning quality across methodology versions. A confirmed answer evaluates the prediction; it does not automatically validate the reasoning. Preserve person-specific answer records for evaluation and preserve generalized methodological lessons for learning, keeping these records distinct.

Part IX — Revisable Research Method and Predictive Performance

1. The method is an instrument, not a fixed ritual

The purpose of the procedure is to discover and predict the Jupiter sign as reliably as the available evidence permits. The research method itself is revisable. Questions may be added, reworded, reordered, or abandoned; new sources may be examined; and alternative analytical procedures may be tried when they are likely to reveal something the current procedure misses. The numbered sequence in this document is a set of safeguards against premature conclusions, not a ritual that must be followed mechanically in every research situation.

2. Preserve the aim and evidential standards, not every procedural step

Methodological flexibility does not permit arbitrary conclusions. Any change should address a specific difficulty, missing distinction, research gap, or observed pattern of errors. Do not change the method merely to rescue a preferred sign, justify an answer already revealed, or make a particular case appear coherent after the fact. Maintain blind prediction, positive discrimination, consistent evidential standards, and separation between the answer key and the prediction process.

3. Ask different questions when the current questions stop helping

The listed questions are useful starting points, not the only questions permitted. Research may show that the key issue lies elsewhere—for example, in a protagonist's choices, the transformation across a body of work, the role of a method, the author's implicit standard of evidence, or a recurring problem–solution structure. Introduce a new question when it has a clear analytical purpose. Explain what it is intended to reveal and how the answer will be tested against the whole-person evidence. Do not add questions simply to generate more material.

4. Separate discovery from evaluation

During discovery, explore alternative questions, sources, theoretical formulations, and methods. During evaluation, assess the resulting predictions using consistent criteria. An approach that generates an elegant interpretation has not necessarily improved prediction. An approach that improves one case may be overfitting if it fails elsewhere. Where possible, evaluate proposed changes across multiple cases, including blind retests, rather than judging them solely by the case that inspired them.

5. Predictive performance is the primary success criterion

The primary practical criterion for the methodology is reliable prediction of the correct sign before the answer is known. Explanatory coherence, theoretical elegance, and interpretive richness matter, but they must not be mistaken for predictive success. Where records permit, track first-guess accuracy, accuracy within a specified number of guesses, mean or median attempts to the revealed answer, clean-retest accuracy, and whether predictions were supported by positive evidence that distinguished the selected sign from its alternatives. Keep these measures separate; eventual success after multiple rejected guesses is not equivalent to first-guess accuracy.

6. Changes must earn their place

Treat methodological and theoretical changes as hypotheses about how to improve performance. When a possible improvement is noticed, compare it with previous cases and look for evidence that it addresses a recurring error. Do not announce a change as successful on the basis of one example. If a change repeatedly fails to improve predictive performance, or makes performance worse, revise or abandon it unless there is a clear reason that the available test was inadequate. If results are inconclusive, continue testing provisionally rather than claiming success or failure prematurely.

7. Revise the right level

When a prediction fails, consider at least four possibilities: (a) the factual account of the person was incomplete or inaccurate; (b) the research questions or method failed to reveal relevant evidence; (c) the application of a sign principle or boundary was mistaken; or (d) the underlying model of Jupiter or the sign–manifestation relationship is inadequate. Do not automatically blame the sign assignment alone, and do not automatically protect the theory. Diagnose which level is most plausibly responsible, while allowing that the evidence may not yet distinguish them.

8. Jupiter's function and sign manifestations remain revisable, but not interchangeable

The current hypothesis is that Jupiter is an underlying function and the sign gives that function its characteristic manifestation. The current description of Jupiter as intuitive legitimacy may be refined or replaced if repeated, independent evidence warrants it. Sign descriptions and boundaries may likewise be

revised when the revisions improve discrimination. But revisions must preserve meaningful differences between signs: if Aries and Taurus are treated as the same manifestation, the model loses its ability to distinguish them. Do not assume in advance either that the current definitions are final or that all sign differences can be dissolved into one undifferentiated principle.

9. Internal monitoring and proposing changes

The analyst should monitor patterns of success and failure internally and need not burden the user with every speculative adjustment. Propose a formal change to the methodology when there is a concrete, generalizable reason to believe it will improve performance. When proposing one, state: (a) the observed recurring problem; (b) the specific change; (c) the evidence that motivates it; (d) the expected benefit; and (e) how the change could be evaluated. If there is no robust general lesson, leave the formal methodology unchanged.

10. Avoid both overfitting and premature rejection

Overfitting occurs when the theory or method is altered to explain each revealed answer, making past cases fit while weakening blind prediction. Premature rejection occurs when a potentially useful method is abandoned because of one unsuccessful guess or too little evidence. Reduce both risks by recording predictions and outcomes, preserving the answer-key separation, evaluating changes across multiple cases where possible, and treating conclusions about performance as provisional when the sample is small.

Governing principle

Preserve the purpose of the investigation and the integrity of its tests, not the method for its own sake. Change questions, research practices, analytical distinctions, or theoretical formulations when evidence gives a reason to do so. Keep a change only when it appears to improve the quality and, above all, the predictive performance of the model. If a change does not improve performance after adequate evaluation, abandon it. If evidence is insufficient, say so rather than claiming an improvement.
